

Comparison of Benefits Illustrating the Effect of the Daniels Bill

The attached chart illustrates the effect of the Daniels bill on actual cases computed for retirement as of 30 June 1969. The computations involve two of the three major benefits of the Daniels bill (adding accrued sick leave to service time and computing average salary on high three years of service). The third major benefit (one percent additional increase in annuity every time a cost-of-living adjustment is triggered) would further erode the CIA Retirement Act annuity by approximately 1 percent each year, more than 10 percent in ten years because of the cumulative effect. Moreover, retirements after 30 June 1969 would result in an even greater annuity disparity. This is because the three pay increases (October 1967, July 1968, and July 1969) pursuant to P. L. 90-206 would have a greater impact on average salary under the high three formula than under the high five formula.
